<p>Structure (1) consists of an inlet (7) for the processed liquid, an outlet (6) for the filtered liquid, a vent (11) and a drain outlet (9). The exit side of the liquid from a cartridge filter (5) is mounted on a baffle plate (4). A stationary plate (2) is arranged at the opposite end of the cartridge filter. The cartridge filter is arranged so that the two plates resist, bind tightly with a bolt (3) and backwash the hollow fibre membrane with pressurised air. The air pressure is set at more than the bubble point of the hollow fibre membrane from the filtration and reverse direction.</p> <p><u>ADVANTAGE</u> Backwashes hollow fibre membrane with high pressure air freely. Extends life of membrane.</p>	<p>(5pp4084DwgNo.1/4)</p>
